1. As we discussed in class one of my classmates raised the topic about the app UberEATS had an option for searching the restaurants, groceries, drinks, rides, etc., that are displayed on home page rather than typing for it. But there is no option for voice few people are unaware of searching option or home page selection and facing difficulties in finding the required Food, groceries, drinks etc., In order to eliminate that I propose some solutions
   - firstly, we should make the voice option enable for the users so that app will be more convenient to the users so that users can easily identify the options that are available in the app.
   - Second, there should be options on filters for Food, groceries, drinks, rides, etc., separately in the app so that the users can easily order their needs.
   - As per the changes made in the filter for the items should be shown under each option separately so that users can access the app easily.
   - And also, there should be video guide for the app explaining the functionalities and

usage of filters about the app and its options.

- In the UberEATS there is a option browse where we can search items, but users may face difficulties to browse with search option there should be voice option to search items . So that users can easily access the app.

2) There will always be a conflict between the user and developer on the respective app where I have some suggestions.

- People who have choosen the option for paid plans there should not be more ads before few days of expiration of plan and after expiration of the paid plan the ads shouldn't disturb them for a few days so that people can opt for app and it also lead to a loyal customer base.
- The app should be designed with less advertisements where the users won't get rid off from the app so that the developer can also maintain huge customer base for the app.

- Developer should provide offer for paid plans, free usage of app for six months rather than one month so that users will show interest to download the app .
- Developers can get more revenue by offering offers to the users.

3. The app called Rapido is a Indian-based ride app that offers the rides for users in the low price and any worker can download freely and there is an option to work with the app without paid plans, a worker can freely access the app. There is option for voice communication and messaging freely in the app. For an illustrator or someone with a design background, the app has a lot of elements that make it really appealing-especially the unique set of emotions, which makes it stand out in comparison to its competitors. Compare to other ride apps the users can easily access for these app. The search option makes it very simple to find place of destination that are essentially customized for your own reactions. Overall, this is definitely a usefull app, it captured my interest by providing special features compare to others.

4. I would like to create an app like where there will be options for task lists, schedules, sharing files, communication regarding meetings in the app we create. When we are driving, we often need to be able to make quick decisions regarding tasks, schedules in these app I want to create option for quick change of tasks, schedules and should be noted to team members quickly. The mobile app that I want to create helps people plan their schedules for their meetings, day plans, immediate changes updates for team or family members. I also want the app to provides you with alternative options to reschedule the tasks or meetings to take you around the difficult situations and get to your works as per the plans made by your own schedule. I want to complete the project with special functionalities and also provide with more advantages for the users.
